

GUARD TOUCH

The intellect you were waiting for...

GUARD TOUCH is revolution and innovation. The new Visa controller, designed by those who create generating sets, marks a radical change in the management and control of the unit. Conceptually different from a technology and operations angle, **GUARD TOUCH** is a user-friendly and versatile device, with an avant-garde interface, capable of interacting directly with the MODbus and CANbus protocols

GUARD TOUCH has 16 programmable and specific time-outs. Allows the visualisation of the alternator's capability and graphic trends, available among 40 different measurements.

GUARD TOUCH is organisation and immediacy. The pages are divided into specific topics that allow parameters to be read clearly, also thanks to a large backlit display.

GUARD TOUCH is a modular and expandable device that can manage Mains/genset switching or a synchronising controller and can also be connected to auxiliary kits, for example, automatic fuel refilling and, in the near future, connect to a remote management module.

GUARD TOUCH allows Multilevel access management.
